

NAME:

Instructions:

1. Keep this exam closed until instructed to begin.
2. **Please write your name on this page but not on any other page.**
3. Please silence any noisy electronic devices you have.
4. Attached sheet(s) provide potentially useful constants and equations. You may detach these from the exam.
5. To receive full credit for your work, please
 - (a) show all your work, using only the exam papers, including the back of this sheet if necessary;
 - (b) specify the correct units, if any, for your final answers;
 - (c) use an appropriate number of significant digits for final numerical answers;
 - (d) **stop writing and close your exam immediately when time is called.**

Other notes:

- **The first page portion of the exam is worth 40 points.** Partial credit for these problems is not necessarily available.
- **Your 2 best scores of the 3 remaining problems will count towards the other 60 points.** Partial credit is available for these problems, so try each problem and do not erase any of your work.

1. 40 points.

(a) The properties of H_2 are predicted by integrating the probability density of the MO wavefunction. Draw a line through any of the integrals in that calculation below that approach zero when $R \rightarrow \infty$.

i) $\int \int 1s_A(1) 1s_A(1) 1s_A(2) 1s_A(2) d\tau_1 d\tau_2$

ii) $\int \int 1s_A(1) 1s_A(1) 1s_A(2) 1s_B(2) d\tau_1 d\tau_2$

iii) $\int \int 1s_A(1) 1s_A(1) 1s_B(2) 1s_B(2) d\tau_1 d\tau_2$

iv) $\int \int 1s_A(1) 1s_B(1) 1s_A(2) 1s_B(2) d\tau_1 d\tau_2$

(b) The triangles below are labeled **A** on the top and **B** on the bottom. Draw the result of carrying each specified operation. (Direction of rotation is up to you, but be consistent.)

(c) Find the direct product $a_{2g} \otimes a_{2u}$ in the point group D_{4h} (the character table is on p. 248).

2. Group theory can be applied not only to small molecules but also to large ones. Below is the structure of the protein Wza viewed from three angles, as given in the literature (*J. Biol. Chem.* **279** 28227-28232, 2004). Identify its point group.

3. A molecule with D_{4h} symmetry has an MO configuration $a_{1g}^2 e_u^2$. Find all the representations of the electronic states resulting from this configuration.

4. Determine the MO configuration for NO_2 , a C_{2v} molecule with the resonance Lewis structures drawn below. Try to give the MO's for a given group of electrons (*e.g.*, lone pair electrons) in order of increasing energy, but don't worry about the ordering of different groups. After writing the configuration, identify which orbitals correspond to which electron groups in the Lewis structures.

Fundamental Constants

Avogadro's number	\mathcal{N}_A	$6.0221367 \cdot 10^{23} \text{ mol}^{-1}$
Bohr radius	$a_0 = \frac{4\pi\epsilon_0\hbar^2}{m_e e^2}$	$5.29177249 \cdot 10^{-11} \text{ m}$
Boltzmann constant	k_B	$1.380658 \cdot 10^{-23} \text{ J K}^{-1}$
electron rest mass	m_e	$9.1093897 \cdot 10^{-31} \text{ kg}$
fundamental charge	e	$1.6021773 \cdot 10^{-19} \text{ C}$
permittivity factor	$4\pi\epsilon_0$	$1.113 \cdot 10^{-10} \text{ C}^2 \text{ J}^{-1} \text{ m}^{-1}$
gas constant	R	$8.314510 \text{ J K}^{-1} \text{ mol}^{-1}$
	R	$0.08314510 \text{ L bar K}^{-1} \text{ mol}^{-1}$
	R	$0.08206 \text{ L atm K}^{-1} \text{ mol}^{-1}$
hartree	$E_h = \frac{m_e e^4}{(4\pi\epsilon_0)^2 \hbar^2}$	$4.35980 \cdot 10^{-18} \text{ J}$
Planck's constant	h	$6.6260755 \cdot 10^{-34} \text{ J s}$
	\hbar	$1.05457266 \cdot 10^{-34} \text{ J s}$
proton rest mass	m_p	$1.6726231 \cdot 10^{-27} \text{ kg}$
neutron rest mass	m_n	$1.6749286 \cdot 10^{-27} \text{ kg}$
speed of light	c	$2.99792458 \cdot 10^8 \text{ m s}^{-1}$
